Share, manage, and preserve your content

<http://merritt.cdlib.org>

Merritt is a new cost-effective repository service from the University of California Curation Center (UC3) that lets the UC community manage, archive, and share its valuable digital content. Merritt features

- an easy-to-use interface for deposit and update
- access via persistent URLs
- tools for long-term management
- permanent storage

## Why use Merritt?

Merritt's single, shared solution for sharing, managing, preserving, and disseminating digital materials meets a range of needs. The following are a small sample of Merritt's many uses:

### Take control of your content and provide access how and when you want

Merritt enables campus constituencies to have direct control over the management, curation, access, and preservation of the information resources underpinning their scholarly activities.

### Share research with others

UC researchers have datasets that they would like to share within and across disciplinary communities. Merritt users can share content via persistent URLs.

### Meet the data sharing and preservation requirements of a grant-funded project

Increasingly researchers are required by funding agencies to preserve and share data (such as observational data, experimental results, and code books) as a condition of a grant. Merritt can be used to manage, share, and preserve the research outputs of a grant.

### Provide long-term preservation

The UC community holds valuable and unique collections in their libraries, museums, and archives (e.g. specimens, oral history recordings, or photographs) that they would like to make available online and preserve for future use. Merritt provides a trustworthy and dependable environment for the long-term management of these valuable materials.

Use Merritt to provide long-term preservation of digital assets, share your research with others or meet the data sharing and preservation requirements of a grant-funded project.

Merritt is built upon a Micro-Services approach to digital curation based on devolving curation function into a set of independent, but interoperable, services that embody curation values and strategies. Since each of the services is small and self-contained, they are collectively easier to develop, deploy, maintain, and enhance. This design approach is detailed in the *UC3 Curation Foundations* paper.
